Objet : Mesures de vibrations lors du passage des trains et du trafic véhiculaire  
Cour Louvain  
Rues de Louvain, St-Hubert, Port-Royal Est et Ave Christophe Colomb  
Montréal, Québec

---

Monsieur,

Conformément à votre demande, nos représentants ont effectué un relevé de vibrations ambiantes lors du passage des trains et du trafic véhiculaire sur le site de la cour Louvain située dans le quadrilatère des rues de Louvain, St-Hubert et Port-Royal Est et de l'avenue Christophe-Colomb à Montréal.

Le but de ce relevé est de quantifier les intensités de vibrations de base (normaux), afin de vérifier leurs effets sur les futures constructions sur le site. Les mesures de vibrations se sont déroulées entre le 7 et le 14 juin 2010.

## **1.0 MÉTHODE D'ENREGISTREMENT**

### **1.1 Instrumentation**

Les vibrations générées par les trains et le trafic véhiculaire ont été enregistrées à l'aide de quatre (4) séismographes triaxiaux de marque Instantel. L'instrument se déclenche chaque fois que se produit une vibration supérieure à un seuil préétabli.

Les données de vibrations pour chaque point de lectures sont gardées en mémoire pour référence et traitées par ordinateur à nos bureaux.

Les informations enregistrées pour chaque événement consistent en une vitesse résultante vectorielle des vitesses transversales, longitudinales et verticales enregistrées en un même point de détection, déplacement et accélérations, ainsi que les fréquences associées.

## 1.2 Installation

Quatre (4) séismographes ont été utilisés pour enregistrer les vibrations durant notre étude. Les endroits précis de prise de lecture ont été choisis selon nos recommandations et 15 points ont été localisés. La localisation exacte des essais est indiquée sur le plan joint à l'annexe I. Les géophones des appareils ont été installés directement sur le sol : asphalte, structure, bordure ou trottoir selon l'emplacement, à chaque point de lecture.

Un sac de sable a été déposé sur le géophone de chaque séismographe afin de minimiser tout risque de déclenchement accidentel de l'équipement, non représentatif des vibrations ambiantes. Se référer à l'annexe II pour les photographies de l'installation.

## 2.0 RÉSULTATS ENREGISTRÉS

Les tableaux suivants résument les événements typiques enregistrés lors du passage du trafic véhiculaire et des trains pour chaque point de lecture. Tous les résultats sont des valeurs crête (peak to peak) utilisées pour les vibrations ambiantes (transitoires). Les fréquences, accélérations et déplacements associés aux valeurs crêtes sont identifiés pour chaque lecture.

### 3.0 COMMENTAIRES

1. L'échantillonnage de mesures de vibrations a été effectué à temps continu entre le 7 et le 14 juin 2010. Plus de 15 points de lecture ont été ciblés afin d'enregistrer les mesures de vibrations générées par le trafic véhiculaire et celui des trains. Cette période d'essai est représentative des vibrations générées par les véhicules et les trains circulant quotidiennement à proximité du site de la cour Louvain située à Montréal, pour une exploitation dite normale.
2. La source des vibrations est principalement liée à la circulation des trains sur la ligne Montréal-Nord du CN, direction est-ouest. Les activités quotidiennes incluent les déplacements très lents et d'autres plus rapides des trains de marchandises et/ou de trains de banlieue sur la voie au nord du site. Il ne nous a pas été possible de distinguer les trains de marchandises de ceux de l'AMT ou de passagers car notre présence sur le site n'a pas été continue. Par contre, selon les informations obtenues du CN, nous savons que le nombre de trains approximatif est d'environ sept (7) trains de marchandises par jour et six (6) trains de passagers par semaine.
3. Le type de vibrations générées par les trains peut être défini comme une onde cyclique continue de courte durée pendant le passage des trains, suivi de plus longues périodes de repos entre chaque passage successif des trains. Donc, il y a des longues périodes durant la journée sans vibrations.

Les vibrations enregistrées sont de faible intensité et certaines n'ont pas pu être notées. Le seuil de déclenchement du séismographe a été fixé au niveau minimum de l'appareil, soit 0,13 mm/sec, et un nombre inférieur à huit (8) trains par jour a été relevé, tel que spécifié par le CN.

4. Les résultats de vibrations maximales enregistrées lors de notre étude pour le trafic véhiculaire ont été de l'ordre de <0,13 à 0,137 mm/sec et pour les trains de l'ordre de 0,163 à 0,439 mm/sec. Voir annexes III et IV pour les détails de chaque événement maximum enregistré, cité dans le tableau no 1. Ces niveaux de vibration sont considérés comme étant sécuritaires pour les structures adjacentes à la cour Louvain.
5. Les informations transmises de la part du CN nous indiquent que le trafic ferroviaire devrait être ajusté pour des projections futures. Normalement, le facteur d'ajustement est de 2.5% par année sur une période d'au moins 10 ans. L'augmentation future du trafic ferroviaire (train de l'AMT) ne devrait pas avoir d'impact sur les résultats sismiques, par contre elle aura une influence sur la fréquence des passages des trains.
6. À titre comparatif, les vibrations générées en milieu urbain par du trafic véhiculaire, travaux de constructions, entretien des routes, etc. pourraient causer des intensités de vibrations de l'ordre de 1,0 à 10,0 mm/sec selon la distance et la source de vibration.
7. Les vibrations enregistrées sur le site de cour Louvain lors de notre étude peuvent être qualifiées comme imperceptibles à juste perceptibles, tel que montré à l'annexe V, qui décrit la sensibilité des personnes aux vibrations verticales. Le degré de perception est variable selon les personnes.
8. La présente étude permet aux ingénieurs concepteur d'identifier les types de fondations qui pourraient être utilisés pour minimiser les effets des vibrations sur les utilisateurs.

Nous espérons le tout à votre entière satisfaction. N'hésitez pas à communiquer avec nous pour de plus amples renseignements.

Veillez agréer, Monsieur, nos salutations distinguées.
