

It is essential that L'Anse a l'Orme stays intact and untouched by any human development. We cannot afford to lose any more land on the island of Montreal.

When you know that the temperature in the city is generally four to five degrees warmer than outside Montreal due to building density, it is just common sense to try and lower building density rather than increasing it and certainly not destroy precious pristine forest. We need to work with intent, knowledge and common sense to minimize the effect of global warming.

Predictions in the Arctic are that arctic ice will disappear by 2030. That is 13 years from now.

My serious concern is, once we in all of Canada have lost our air conditioner, the arctic ice, what are already overheated cities going to be like to live in? Montreal is not and will not be any exception.
